MANUAL SOFTWARE TESTING

A. CHIRANJEEVRAJ
11-1 PM,

TEST Design Techniques:-

They are systematic method used to create effective test case. they help testers identify defects while reducing the number of test cases needed.

(i) Equivalence Partitioning (EP):-

Divides input data into valid & invalid groups.

Example:-

18-60

valid - 25 ✓

invalid - 17 ✗

invalid - 61 ✗

(ii) Boundary value Analysis (BVA):

It tests values at the boundaries because defects often occur there.

Example:

If the valid age is 20-50.

Test values: 16, 17, 18, 19, 20, 48, 49, 50, 52, 53, 54

(iii) Decision Table Testing:-
 It is used when the output depends on multiple conditions.
 Example: Login System.

Username	Password	Expected Result.
valid	valid	Login Successful
Invalid	valid	Error in Username
valid	Invalid	Error in Password
Invalid	Invalid	Error Message

(iv) Static Transition Testing:-

To check how the system behaves when moving from one state to another.

Example:-

ATM PIN

Correct PIN - Login Success

Three Incorrect PINs - Account Locked

(v) Use Case Testing:-

Test complete flow of a user action

Example:- online shopping:

• Login → Search Product → Add to cart → Make Payment → order confirmation.
